                                                                    Detecting, preventing and treating sensitivity to cat protein allergen comprises combining a biological sample with a human {\tt T} cell reactive feline protein and determining the extent of binding that occurs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a modified human T-cell reactive feline protein which stimulates T-cells from an individual who is allergic to cats, but which interacts with human IgE to a lesser extent than does affinity purified TRRP! The protein is modified by treating with either a mild alkali (pH 12.5-13.5 , KOH, NaOH, LiOH or tertiary amines) or an enzyme which removes O-linked groups (carbohydrate modieties). It is useful in desensitising people who are allergic to cats.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the detection of sensitivity to a cat protein allergen by combining a blood sample from a subject with a peptide of human T cell reactive feline protein (hTRFP). This method and the hTRFP peptides are useful for diagnosing, preventing and treating cat allergies by reducing or abolishing an individual's allergic response to a cat allergen. DNA encoding the TRFP may be used as probes to locate equivalent sequences present in other species. These may further be used to study the mechanism of immunotherapy of cat allergy, and to design modified derivatives, analogues or functional equivalents useful in immunotherapy. The present sequence was used in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC different covalently linked peptide chains with a molecular weight of 20 CC kD, 40 kD or 130 kD under non-reducing conditions and 5 kD or 10-18 kD CC under reducing conditions. The products of the invention have CC antiallergic activity and act as human T cell stimulators. TRFP is useful CC for reducing or preventing the adverse effects of cat allergens on cat CC ellergic individuals and in ex vivo diagnostic tests to determine which CC peptides cause sensitivity so as to selectively use them to desensitize CC act sensitive individual. Purified TRFP is also useful for studying CC the mechanism of immunotherapy of cat allergy and to design modified CC derivatives, analogs or functional equivalents that are more useful in CC immunotherapy against cat allergy. DNA sequences present in other species (goats, sheep, dogs, rabbits or horses) that may be useful in diagnostics CC and/or therapeutics. Fully defined and characterized TRFP provides CC complete and a very simple desensitization therapy. This sequence CC represents a human T cell reactive feline protein (also known as Fel d I) CC chain 2, long form which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is a peptide chain of the human T cell reactive feline protein (TRFP) of the invention. The protein is a cat protein allergen, and was isolated from a vacuum bag extract obtained by affinity purification of house dust collected from several homes with cats. TRFP is composed of two covalently linked peptide chains, and is also referred to as Fel d . TRFP and its peptides are useful for reducing or preventing the adverse effects that exposure to cat allergens normally has on cat allergic individuals (i.e. to desensitise individuals to cat allergens or block the effect of the allergens). TRFP is also used in methods of diagnosing sensitivity to Felis domesticus in an individual. DNA sequences encoding TRFP can be used as probes to locate equivalent sequences present in other species, e.g. goat, sheep, horse, rabbit and dog, that may be useful in a diagnostic and/or therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               T-cell reactive feline protein; TRPP; T cell epitope; T cell receptor; down regulation; immune response; allergen; immunoglobulin E; sensitivity; cat protein allergen; human; chain 2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel peptide (I) of human T cell reactive feline protein (hTRFP) having at least one T cell epitope recognized by a T cell receptor specific for the human T cell reactive feline protein, the peptide consisting of at least 7-30 amino acids, and having an amino acid sequence derived from an amino acid sequence cerived from an amino acid sequence cerived from an amino acid sequence optides, given in the specification. The peptides have reduced lumunoglobulin E binding and reduce T cell responsiveness. The peptide (I) is useful in compositions for treating sensitivity to a cat protein allergen in a subject. This sequence represents the human TRFP chain 2 (long form).
                                                                                                                                                                                                                       16-OCT-1991;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chains 1 and 2 of the TREP have been recombinantly expressed coli and purified. T cell epitope studies using overlapping regions derived from the TREP maino acids sequence were used identify multiple T cell epitopes in each chain of TREP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombitope peptide having T-cell stimulating activity - for diagnosis and treatment of sensitivity to protein allergens, auto:antigens and protein antigens

                      This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide derived from the allergen where restriction to a MHC Class II molecule possessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who possesses the MHC Class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and weed (including ragweed) pollens, fungi and moulds, foods, stinging insects, the content of the content

```

Poly-A mRNA from cat parotid and mandibular glands was used to produce cDNA clones for both chain 1 and chain 2 of TRFP. These clones were then used to screen a cat genomic library. Chain 1 exists in two forms having different leader sequences (A and B). The sequence can be used to express the protein and peptide derivs which stimulate T-cells in persons allergic to cats. The present invention relates to the detection of sensitivity to a cat protein allergen by combining a blood sample from a subject with a peptide of human T cell reactive feline protein (hTRFP). This method and the hTRFP peptides are useful for diagnosing, preventing and treating cat allergies by reducing or abolishing an individual's allergic response to a cat allergen. DNA encoding the TRFP may be used as probes to locate equivalent sequences present in other species. These may further be used to study the mechanism of immunotherapy of cat allergy, and to design modified derivatives, analogues or
                                                                                                                                                                                                                                                                                                               Detecting, preventing and treating sensitivity to cat protein allergen comprises combining a biological sample with a human T cell reactive feline protein and determining the extent of binding that occurs -

They can also be used to identify epitopes responsible for sensitivity. The DNA can be used to detect comparable sequence in other species, and also for prodn. of modified forms of TRFP esp. showing reduced binding to 1gE and thus reduced tendency to cause adverse reactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (IMMU-) IMMULOGIC

Ŧ

This invention describes a novel naturally occurring cat protein allergen (1), human T cell reactive feline protein (TRFP), comprising two different covalently linked peptide chains with a molecular weight of 20 kD, 40 kD or 130 kD under non-reducing conditions and 5 kD or 10-18 kD under reducing conditions. The products of the invention have antiallergic activity and act as human T cell stimulators. TRFP is useful for reducing or preventing the adverse effects of cat allergens on cat allergic individuals and in ex vivo diagnostic tests to determine which peptides cause sensitivity so as to selectively use them to desensitize a cat sensitive individual. Purified TRFP is also useful for studying the mechanism of immunotherapy of cat allergy and to design modified the mechanism of immunotherapy of cat allergy and to design modified derivatives, analogs or functional equivalents that are more useful in

Example 2; Column 81-84; 106pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunotherapy against cat allergy. DNA sequences encoding TRFP are useful as probes to locate equivalent sequences present in other species (goats, sheep, dogs, rabbits or horses) that may be useful in diagnostics and/or therapeutics. Fully defined and characterized TRFP provides complete and a very simple desensitization therapy. This sequence represents a human T cell reactive feline protein (also known as Fel d I)
This invention describes a novel peptide (I) of human T cell reactive feline protein (hTRFP) having at least one T cell epitope recognized by a T cell receptor specific for the human T cell reactive feline protein, the peptide consisting of at least 7-30 amino acids, and having an amino acid sequence derived from an amino acid sequence comprising 94. 96. 97, 109, or 111 residues, given in the specification. The peptides down regulate the immune response to the allergen. The peptides have
                                                                                                                                                                                                                                                               Peptides of human T cell reactive feline protein sensitivity to cat protein allergens comprise at epitope recognized by a T cell receptor specific
                                                                                                                                                                                                  Example
                                                                                                                                                                                                                                                                                                                                                                       WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  þ
```

produce cDNA clones for both chain I and the produce cDNA clones for both chain I clones were then used to screen a cat genomic library. Chain I exists in two forms having different leader sequences (A and B). The sequence can be used to express the protein and peptide derives which stimulate T-cells in persons allergic to cats. The peptides can be used to reduce/ellminate the allergic response partic by modificn. of lynphokine prodn. by the T-cells. They can also be used to identify epitopes responsible for sensitivity. The DNA car be used to detect comparable sequence in other species, and also

Poly-A mRNA from cat parotid and mandibular glands was used to produce cDNA clones for both chain 1 and chain 2 of TRFP. These

           The present invention relates to the detection of sensitivity to a cat protein allergen by combining a blood sample from a subject with a peptide of human T cell reactive feline protein (hTRFP). This method and the hTRFP peptides are useful for diagnosing, preventing and treating cat allergies by reducing or abolishing an individual's allergic response to a cat allergen. DNA encoding the TRFP may be used as probes to locate equivalent sequences present in other species. These may further be used to study the mechanism of immunotherapy of cat allergy, and to design modified derivatives, analogues or functional equivalents useful in immunotherapy. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        02-SEP-1994;

This invention describes a novel naturally occurring cat protein allergen (17), human T cell reactive feline protein (TRFP), comprising two different covalently linked peptide chains with a molecular weight of 20 kD, 40 kD or 130 kD under non-reducing conditions and 5 kD or 10-18 kD under reducing conditions. The products of the invention have antiallergic activity and act as human T cell stimulators TRFP is useful for reducing or preventing the adverse effects of cat allergens on cat allergic individuals and in ex vivo diagnostic tests to determine which peptides cause sensitivity so as to selectively use them to desensitize a cat sensitive individual. Purified TRFP is also useful for studying the mechanism of immunotherapy of cat allergy and to design modified derivatives, analogs or functional equivalents that are more useful in immunotherapy against cat allergy. DNA sequences encoding TRFP are

                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A_Geneseq_1101:*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a modified human T-cell reactive feline protein which stimulates T-cells from an individual who is allergic to cats, but which interacts with human IgE to a lesser extent than does affinity purified TRPP! The protein is modified by treating with either a mild alkali (pH 12.5-13.5 , KOH, NaOH, LiOH or tertiary amines) or an enzyme which removes 0-linked groups (carbohydrate modieties). It is useful in desensitising people who are allergic to cats.
                             Detecting, preventing and treating sensitivity to cat protein allergen comprises combining a biological sample with a human T cell reactive feline protein and determining the extent of binding that occurs -

                                                                                                                                                                                               The present invention relates to the detection of sensitivity to a cat protein allergen by combining a blood sample from a subject with a peptide of human T cell reactive feline protein (hTREP). This method and the hTREP peptides are useful for diagnosing, preventing and treating cat allergies by reducing or abolishing an individual's allergic response to a cat allergen. DNA encoding the TREP may be used as probes to locate equivalent sequences present in other species. These may further be used to study the mechanism of immunotherapy of cat allergy, and to design modified derivatives, analogues or functional equivalents useful in immunotherapy. The present
                                                                                                                                                    Sequence

New human T cell reactive feline protein useful for reducing or abolishing individual's allergic response to cat allergen comprising two different covalently linked peptide chains

Claim 2 75-76; 106pp; English.

This invention describes a novel naturally occurring cat protein allergen (I), human T cell reactive feline protein (TRFP), comprising two

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC different covalently linked peptide chains with a molecular weight of 20 CC kD, 40 kD or 130 kD under non-reducing conditions and 5 kD or 10-18 kD CC under reducing conditions. The products of the invention have CC antiallergic activity and act as human T cell stimulators. TRFP is useful CC for reducing or preventing the adverse effects of cat allergens on cat CC allergic individuals and in ex vivo diagnostic tests to determine which CC peptides cause sensitivity so as to selectively use them to desensitize CC a cat sensitive individual. Purified TRFP is also useful for studying CC the mechanism of immunotherapy of cat allergy and to design modified CC derivatives, analogs or functional equivalents that are more useful in immunotherapy against cat allergy. DNA sequences encoding TRFP are CC useful as probes to locate equivalent sequences present in other species (goats, sheep, dogs, rabbits or horses) that may be useful in diagnostics and/or therapeutics. Fully defined and characterized TRFP provides CC complete and a very simple desensitization therapy. This sequence CC represents a human T cell reactive feline protein (also known as Fel d I) CC chain 2, long form which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

```
This sequence is a peptide chain of the human T cell reactive feline protein (TRFP) of the invention. The protein is a cat protein allergen, and was isolated from a vacuum bag extract obtained by affinity purification of house dust collected from several homes with cats. TRFP is composed of two covalently linked peptide chains, and is also referred to as Fel d I. TRFP and its peptides are useful for reducing or preventing the adverse effects that exposure to cat allergens normally has on cat allergic individuals (i.e. to desensitise individuals to cat allergens or block the effect of the allergens). TRFP is also used in methods of diagnosing sensitivity to Felis domesticus in an individual. DNA sequences encoding TRFP can be used as probes to locate equivalent sequences present in other species, e.g. goat, sheep, horse, rabbit and dog, that may be useful in a diagnostic and/or therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                               New human {\tt T} cell reactive feline protein, useful for desensitizing allergic individuals to cat allergens -

The peptides have reduced immunoglobulin E binding and reduce T cell responsiveness. The peptide (I) is useful in compositions for treating sensitivity to a cat protein allergen in a subject. This sequence represents the human TRFP chain 2 (long form).

```
New pure covalently linked human T cell reactive feline protein and modified peptide(s), used to reduce effects of cat allergens and to diagnose sensitivity to allergens.
```

Claim 2; Fig 3; 70pp; English

poly-A mRNA from cat parotid and mandibular glands was used to produce cDNA clones for both chain 1 and chain 2 of TRFP. These clones were then used to screen a cat genomic library. Chain 1 exists in two forms having different leader sequences (A and B). The sequence can be used to express the protein and peptide derivs which stimulate T-cells in persons allergic to cats. The peptides can be used to reduce/eliminate the allergic response partic. by modifion of lynphokine prodn. by the T-cells. They can also be used to detect comparable sequence in other species, and also for prodn. of modified forms of TRFP esp. showing reduced binding to IgE and thus reduced tendency to cause adverse reactions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chains 1 and 2 of the TRFP have been recombinantly expressed coll and purified. T cell epitope studies using overlapping regions derived from the TRFP amino acids sequence were used identify multiple T cell epitopes in each chain of TRFP.

Peptides derived from TREP may be used in a therapeutic composition which is useful in treating diseases which involve an immune response to a protein antigen. This composition may be used to induce tolerance in a mammal to Dermatophagoides, may be used to induce tolerance in a mammal to Dermatophagoides,
This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide derived from the allergen where restriction to a MHC Class II molecule possessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who possesses the MHC Class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and weed (including ragweed) pollens, fungi and moulds, foods, stinging insects, the chiromidae (non-biting midges), spiders and mites, housefly, fruit fly, sheep blow fly, screw worm fly, grain weevil, silkworm, honeybee,

                      This sequence represents a modified human T-cell reactive feline protein which stimulates T-cells from an individual who is allergic to cats, but which interacts with human 1gE to a lesser extent than does affinity purified TRPP. The protein is modified by treating with either a mild alkali (pH 12.5-13.5 , KOH, NBOH, LiOH OF TERTIATY amines) or an enzyme which removes 0-linked groups (carbohydrate moietties). It is useful in desensitising people who are allergic to ca
                                                                                                                                                                Modified human T-cell reactive feline protein - stimulates T-cell in individuals allergic to cats and shows reduced histamine-releasing properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                non-biting midge larvae, bee moth larvae, mealworm, cockroach, larvae of Tenibrio molitor beetle, mammals such as cat, dog, horse, cow, pig, sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence represents the cat allergen | 1082946 Fel dI chain 2 precursor.

                   The present invention relates to the detection of sensitivity to a cat protein allergen by combining a blood sample from a subject with a peptide of human T cell reactive feline protein (hTRFP). This method and the hTRFP peptides are useful for diagnosing, preventing and treating cat allergies by reducing or abolishing an individual's allergic response to a cat allergen. DNA encoding the TRFP may be used as probes to locate equivalent sequences present in other species. These may further be used to study the mechanism of immunotherapy of cat allergy, and to design modified derivatives, analogues or functional equivalents useful in immunotherapy. The present sequence was used in the invention.
                                                                                                                                                                                                            Detecting, preventing and treating sensitivity to cat protein allergen comprises combining a biological sample with a human T cell reactive feline protein and determining the extent of binding that occurs

                                                                                                      (1), human T cell reactive feline protein (TRPP), comprising two different covalently linked peptide chains with a molecular weight of 20 kD, 40 kD or 130 kD under non-reducing conditions and 5 kD or 10-18 kD under reducing conditions. The products of the invention have antiallergic activity and act as human T cell stimulators. TRPP is useful for reducing or preventing the adverse effects of cat allergens on cat allergic individuals and in ex vivo diagnostic tests to determine which peptides cause sensitivity so as to selectively use them to desensitize a cat sensitive individual. Purified TRPP is also useful for studying
                                                                                                                                                                                                                                                                                                                                                                                   Kuo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   T-cell reactive antiallergic; T
immunotherapy against cat allergy. DNA sequences encoding TRFP are useful as probes to locate equivalent sequences encoding TRFP are (goats, sheep, dogs, rabbits or horses) that may be useful in diagnostics and/or therapeutics. Fully defined and characterized TRFP provides complete and a very simple desensitization therapy. This sequence represents a human T cell reactive feline protein (also known as Fel d I)
                                                                                                                                                                                                                                                    Claim
                                                                                                                                                                                                                                                                                         New human T cell reactive feline protein useful for reduci
abolishing individual's allergic response to cat allergen
                                                                                                                                                                                                                                                                                                                                                                        Greenstein

This sequence is a peptide chain of the human T cell reactive feline protein (TRPP) of the invention. The protein is a cat protein allergen, and was isolated from a vacuum bag extract obtained by affinity purification of house dust collected from several homes with cats. TRPP is composed of two covalently linked peptide chains, and is also referred to as Fel d I. TRPP and its peptides are useful for reducing or preventing the adverse effects that exposure to cat allergens normally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

This invention describes a novel peptide (I) of human T cell reactive feline protein (hTRFP) having at least one T cell epitope recognized by a T cell receptor specific for the human T cell reactive feline protein, the peptide consisting of at least 7-30 amino acids, and having an amino acid sequence derived from an amino acid sequence comprising 9, 97, 109, or 111 residues; given in the specification. The peptides down regulate the immune response to the allergen. The peptides have
                                                                                                                                                                                                                                                                         Peptides of human T cell reactive feline protein sensitivity to cat protein allergens comprise at epitope recognized by a T cell receptor specific reactive feline protein -
                                                                                                                                                                                                                         Claim 1; Column 79-80; 105pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             has on cat allergic individuals (i.e. to desensitize individuals to cat allergens or block the effect of the allergens). TRFP is also used in methods of diagnosing sensitivity to Felis domesticus in an individual. DNA sequences encoding TRFP can be used as probes to locate equivalent sequences present in other species, e.g. goat, sheep, horse, rabbit and dog, that may be useful in a diagnostic and/or therapeutic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY51471 standard; Protein;

Poly-A mRNA from cat parotid and mandibular glands was used to produce cDNA clones for both chain 1 and chain 2 of TRFP. These clones were then used to screen a cat genomic library. Chain 1 exists in two forms having different leader sequences (A and B). The sequence can be used to express the protein and peptide derivs which stimulate T-cells in persons allergic to cats. The peptides can be used to reduce/eliminate the allergic response partic. by modificn. of lymphokine prodn. by the T-cells. They can also be used to identify epitopes responsible for sensitivity. The DNA can be used to detect comparable sequence in other species, and also be
